Where can state survive a pause?

GPU memory

Pause; retain powered state
Include GPU and support
Resume preserved progress

Host memory

Transfer takes time/power
Release GPU; retain host
Compatibility is required

Persistent storage

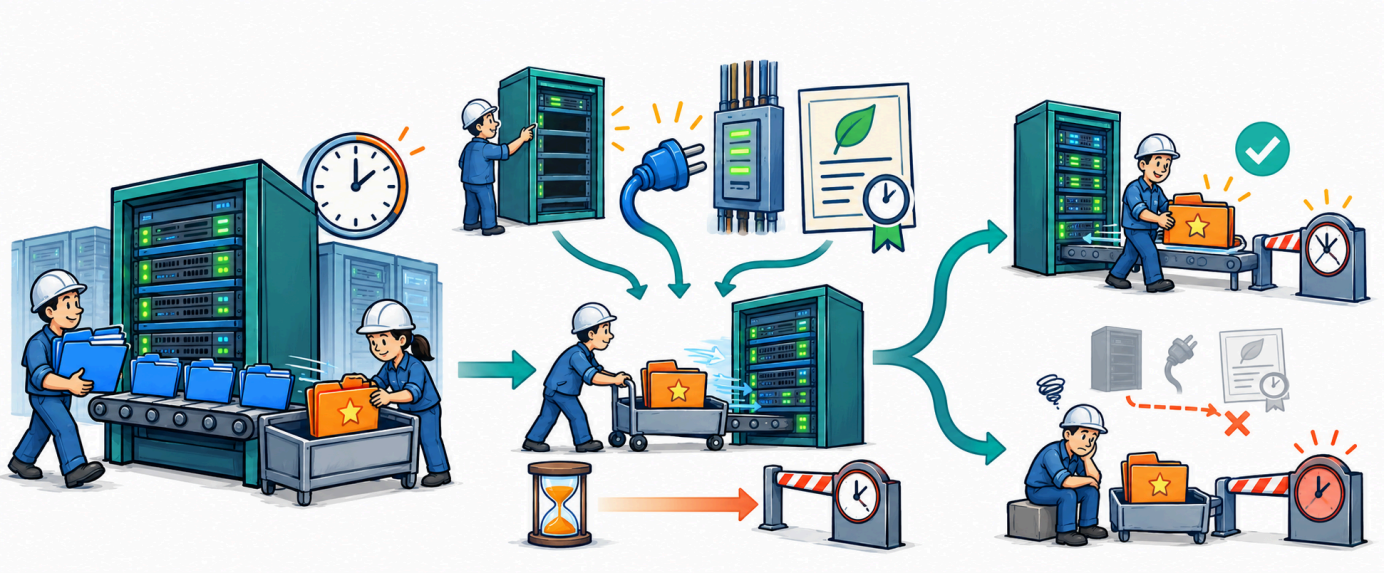

Save fully before shutdown
Staging is not persistence
Count saving/restoration

Host staging can precede persistence; check power and completion separately.

Can a permitted path protect the necessary state?

Yes: resumed work must still meet deadlines. Insufficient evidence: unresolved.

No: charge only lost progress as recomputation, then recheck deadlines.

Execution and recovery need equipment, supply and CFE before the deadline.
