Staged interconnection and flexibility deliverability: study framework

1. Given inputs and common rules

Business progress — Task arrivals and deadlines

Equipment progress — Commissioned K and idle load

Grid progress — Built network and supply

Given F/X plan, adjustment capacity D, operating policy, hourly CFE target and limits

2. Same inputs and service rules three assessments

Instantaneous MW

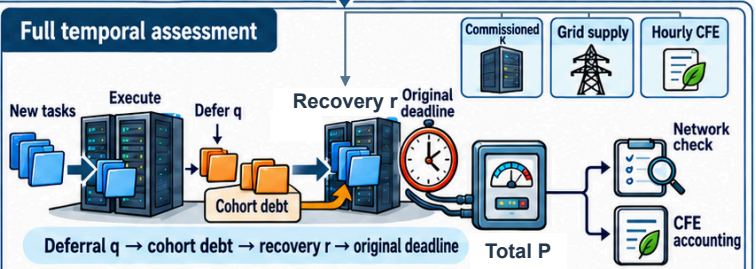

Current adjustable capacity

Fixed recovery headroom

Preset recovery reserve

Full temporal assessment

3. Stage judgments and bottlenecks

Compare stage judgments and bottleneck sources

○ Commitment gaps • CFE gaps • overdue • unresolved

Freeze plan — Independent new path

4. Independent holdout: applicability and failure regions

Freeze plan, capacity and policy

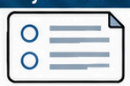

Holdout execution using information available then

One fixed connection point

Applicability and failure regions

Given paths and rules → three assessments → stage judgments → frozen-policy holdout
