Work and equipment may be ready before the grid

When progress paths diverge, which operating conditions change?

Early operation

Work grows; equipment is phased in

→

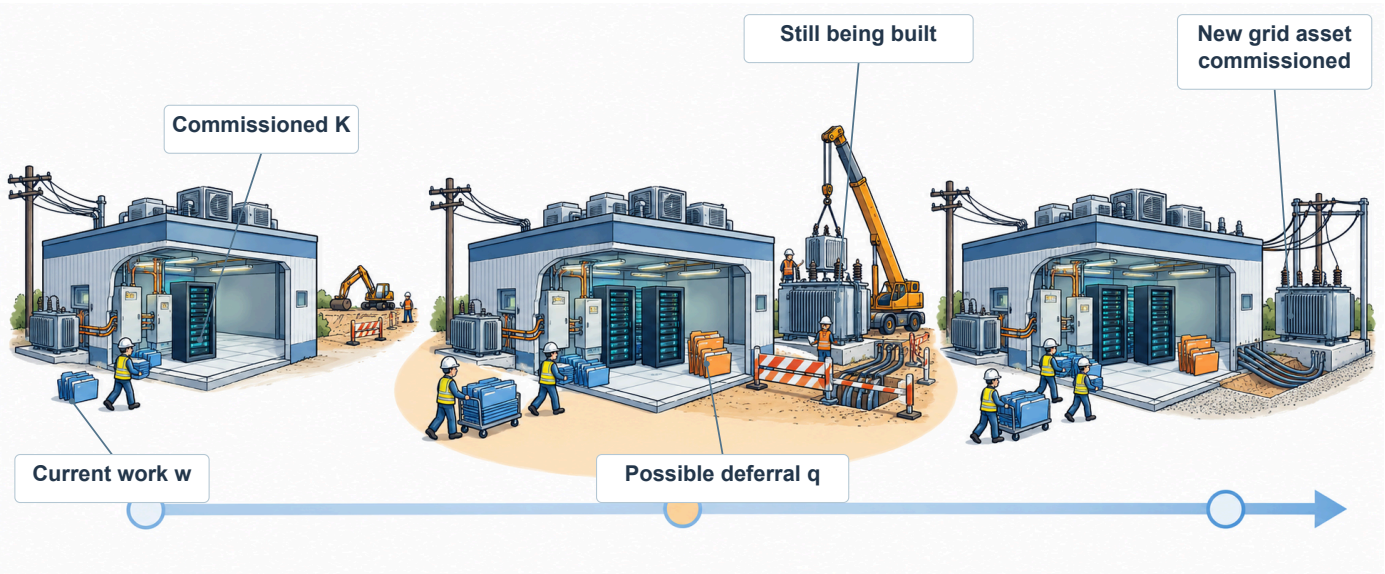

Work ready; reinforcement pending

Only commissioned assets are available

→

Reinforcement commissioned

Reassess on the newly built network

One center through time → existing debt and budgets carry across stages

1 Tasks and equipment

w: external work in this hour
K: commissioned computing capacity
Little work may limit deferral
Spare equipment may allow recovery

→

2 Reinforcement pending

Work and computing may be ready
Supply uses the currently built grid
Recalculate required response calls
Recovery also needs power and CFE

→

3 Reassess after commissioning

New grid conditions change calls
Debt and budgets still carry forward
Recheck response, recovery, deadlines
Delivery follows the complete checks

Progress mismatch → different response and recovery conditions
→ possible changes in stage judgments
